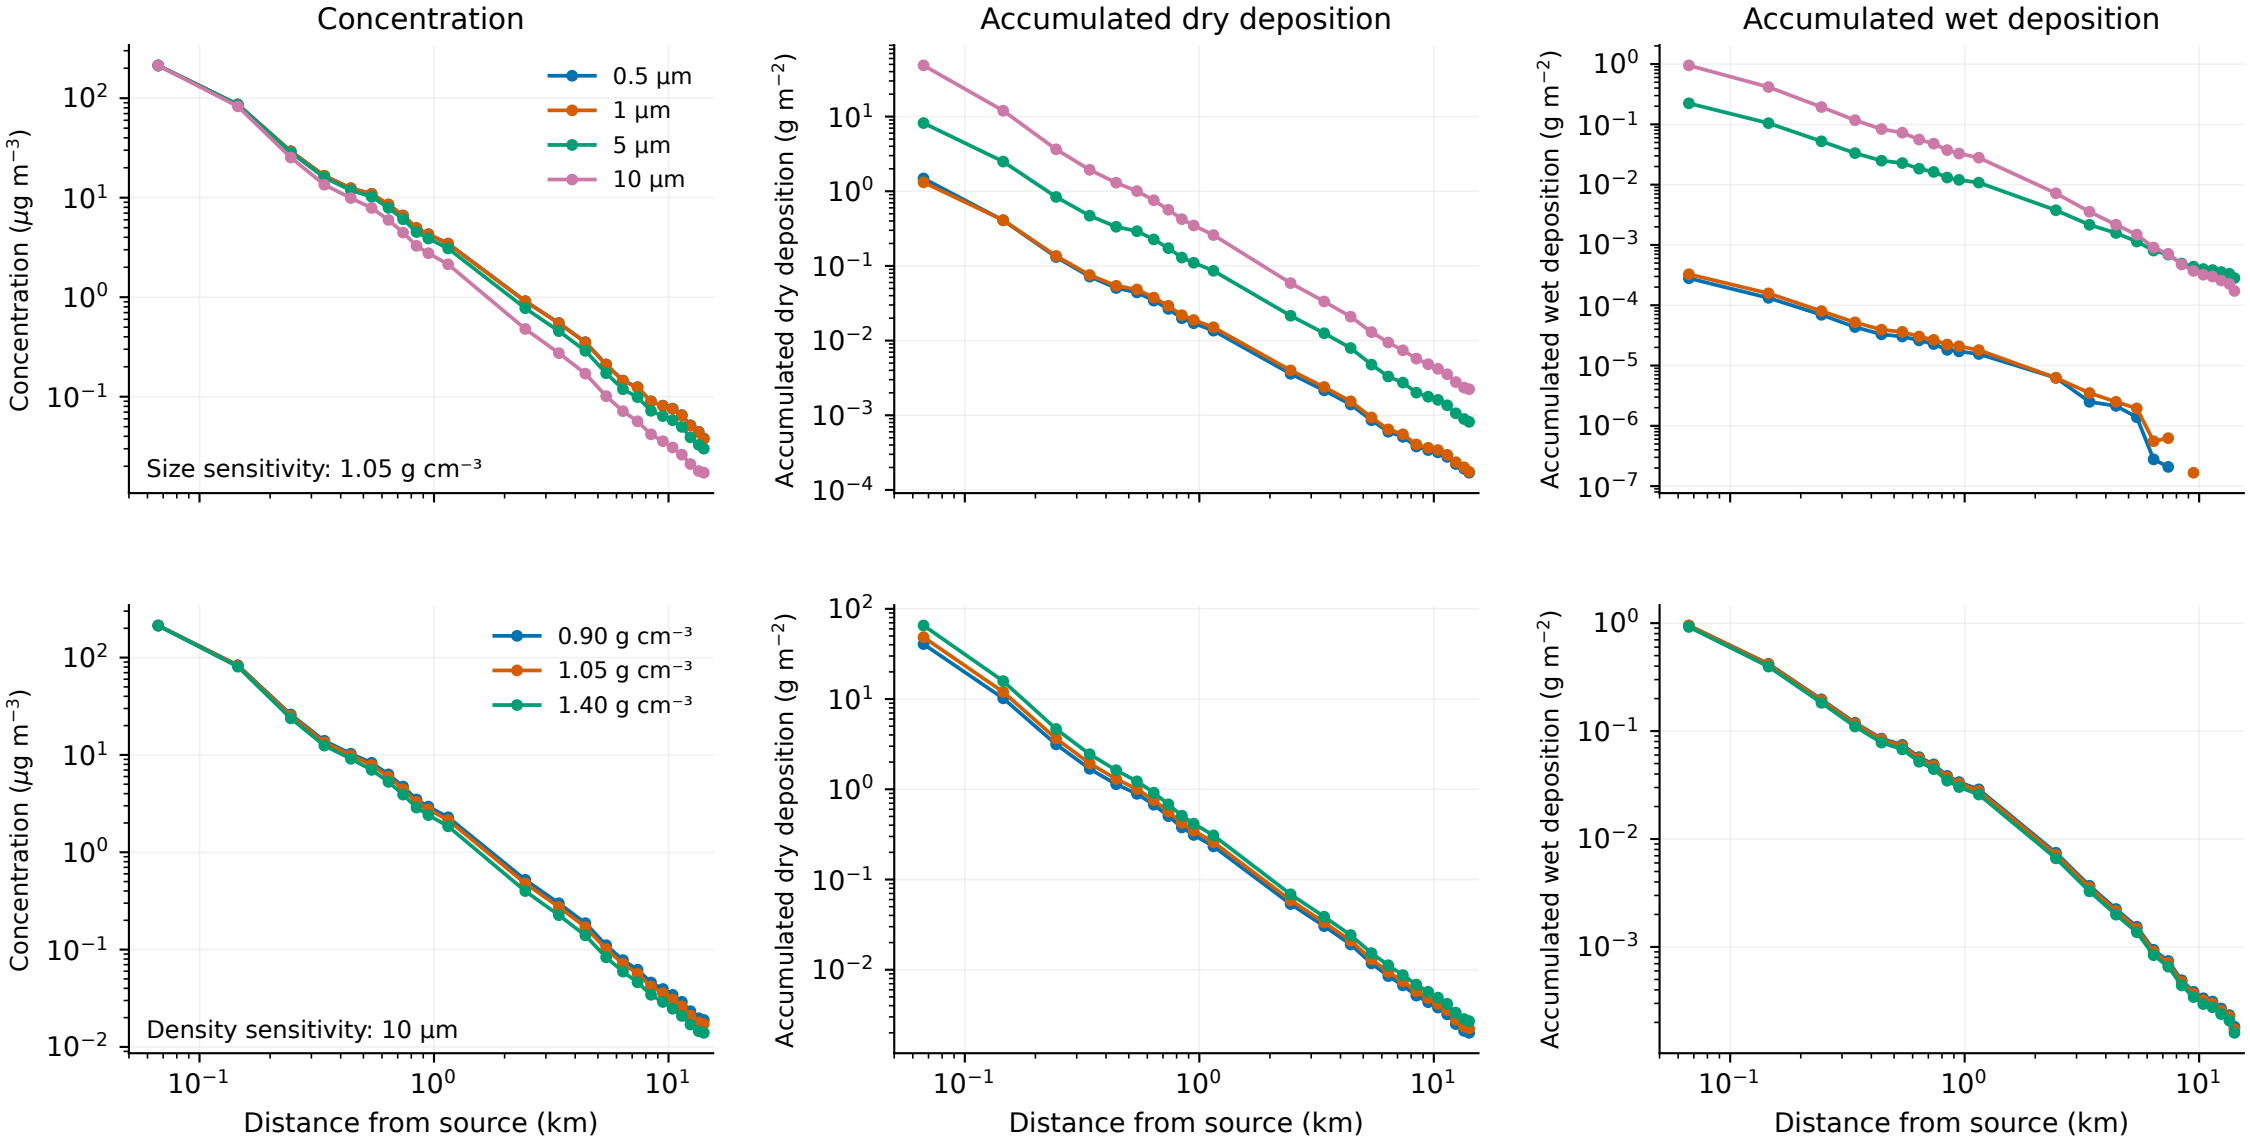
Particle sensitivity near Clemson, 2023
Mean concentration and accumulated deposition by distance annulus



Hypothetical 1 g s⁻¹ source; identical observed weather and equivalent spheres (χ = 1). Arithmetic receptor means, not area integrals.
100 m annuli to 1 km; 1 km annuli beyond. Zero means omitted from logarithmic axes; values can be below printed precision.
Small wet-deposition means inherit native 10^{-5} g m⁻² rounding; averaging does not recover the lost precision.
8,063 valid modeled hours. Direction-averaged profiles are not trajectories or threshold-defined transport distances.
